

Beyond Telederm - Uses of Safe Clinical Photography via the Consultant Connect App

The PhotoSAF feature on the Consultant Connect App allows clinicians to take IG compliant photos on their mobile phone. The photos are not saved to the phone but instead are emailed to the clinician's NHS email address and saved in a secure cloud.

Examples of how NHS areas are using this service:

Cardiology

Clinicians use the PhotoSAF feature on the Consultant Connect App to take photos of ECGs/Echo reports to then share with cardiologists for advice or to save to the patient record.

Dentistry

Community dental services working with people in care homes, with learning disabilities, and in prisons use PhotoSAF. Photos of signed patient consent forms and clinical photos are taken and attached to referrals.

Diabetic Podiatry

PhotoSAF is being used by community foot teams, diabetes inpatient teams, diabetes MDFTs, diabetic podiatry, and OPAT teams to take and share photos internally. The MDFTs also use PhotoSAF to attach photos to e-RS.

Monitoring of patient conditions

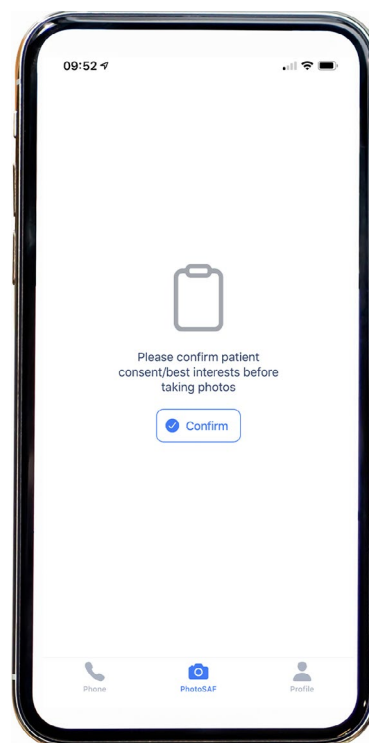

PhotoSAF is used to compare patient conditions over time, such as for monitoring moles, rashes, lesions, leg ulcers and more. Photos are automatically saved in a secure cloud and can be downloaded and attached to the patient record, making it easy for clinicians to review and monitor patient conditions over time.

Ophthalmology

Optometrists are using PhotoSAF to share photos with ophthalmologists for Advice & Guidance.

Research & Innovation Department

Clinical Research Nurses take photos of patient consent forms, while in full PPE, to then upload onto patient records easily (rather than manually scanning each form as they did before). The Clinical Research Nurses also take photos of prescriptions which they can send to the on-site pharmacy team.

Download the free Consultant Connect App from the App Store or Google Play.
